

ABSTRACT

An injectable or insertable dosage form comprising a biodisintegrable binder and an ablation agent in a concentration effective to cause tissue necrosis. The injectable dosage form is a solid or semi-solid dosage form. Due to the solid or semi-solid nature of the dosage form, retention at the site of injection or insertion is improved, thereby improving delivery efficiency of the ablation agents within the dosage form and/or reducing the nonspecific tissue damage associated with the dosage form.
